PROGRAMMING AND OPERATING MANUAL

**DISTRIBUTED SYSTEM
SCE/1
SATELLITE COMMUNICATION EXECUTIVE**

1 DECEMBER 1974

AMD SYSTEM WARRANTY

All Hewlett-Packard electronic measuring systems are warranted to be free from defects in material and workmanship for a period of 90 days. HP will repair or replace, at its option, without charge, any parts which prove to be defective during the warranty period. Warranty service will be performed on-site at the customer's facility in the United States, Canada, Western Europe, and near other designated HP service facilities, except for locations which are inaccessible or not regularly served by suitable public transportation. On-site 90 day systems warranty on all HP instruments is in lieu of the one year return-to-HP warranty described in the individual instrument manuals. No other warranty is expressed or implied. HP is not liable for consequential damages.

PRODUCT SAFETY STATEMENT OF POLICY

AUTOMATIC MEASUREMENT DIVISION HEWLETT-PACKARD CO.

The Automatic Measurement Division (AMD) of Hewlett-Packard Company shall comply with safety standards published by the International Electrotechnical Commission (IEC) to the fullest extent possible. Compliance with these standards is occasionally limited by the appropriateness of existing IEC Publications to particular conditions found in system and subsystem units and certain special applications thereof. To minimize hazards which may occur as a result of insufficient standards, AMD does supplement IEC requirements with certain nationally recognized United States Safety Standards. These standards principally are, but shall not be limited to, the National Electric Code (NFPA-1971) and Underwriters Laboratories.

Complex computer-based system and subsystem units utilizing both active and passive electronic equipment are presumed to contain reasonable hazards that cannot be further moderated at a cost compatible with user needs. Where such hazards may exist, the safety and health of AMD's customers and employees shall be protected to the fullest extent possible. This protection may take the form of, but not be limited to properly placed WARNINGS and USER INSTRUCTIONS.

Unsafe materials, products or conditions resulting from buyer requirements, when these are not considered as an integral part of the standard AMD products, shall be the sole responsibility of the buyer. This would include, but not be limited to, cables or connector accessories supplied at buyer request and intended to be used to interface that standard AMD product with other materials and products, or under conditions not controlled by AMD.

AMD maintains an active safety program to assure compliance with product safety standards to the fullest extent possible. This program includes, but is not limited to, safety inspections using AMD procedures A5951-0532-5 and A5951-0533-5.

For further information or assistance on safety matters, contact your AMD Contracts Administrator.

Protective devices may be required in some applications involving distributed system cabling. Consult with your local authorities on the proper installation of Class 2 (communication, remote control, signal) circuits, prior to deployment.

SECTION I

GENERAL DESCRIPTION

INTRODUCTION

This manual describes the SCE/1 Satellite Communication Executive. SCE/1 resides in the last sixty-four words (protected area) of core, and replaces the paper-tape BBL normally supplied with an HP computer.

SOFTWARE

SCE/1 is supplied as a single paper tape (P/N 29037-60001) which contains both the 64-word SCE/1 and a program for configuring and installing SCE/1 in 4K, 8K, 12K, 16K, 24K, and 32K (memory size) computers.

HARDWARE

The minimum hardware required by SCE/1 consists of:

- HP 2100 computer with 4K of core
- A paper tape reader or Teletype
- HP 12665 Computer Serial Interface Kit
- or
- HP 12773 Computer Modem Interface Kit

PROGRAM DESCRIPTION

SCE/1 is normally resident in the protected area of satellite computers and is used to load programs from the central computer disc into satellite memory. Since SCE/1 resides in the protected memory of the satellite (last 64-words), complete core loads may be accomplished without overlaying the communications executive.

The operator specifies the program stored on the central disc that is to be down-loaded by setting a 5-digit octal number into the satellite switch register (*nnnnn*). The Central Communication Executive (CCE) receives this number, converts it to its ASCII equivalent, prefixes the five digits with the letter 'P', and uses the six characters thus synthesized (*Pnnnnn*) as the name of the file to down-load.

SECTION II

PROGRAM OPERATION

INTRODUCTION

SCE/1 is an absolute Assembly Language program. It is installed in the protected area of the satellite computer via the switch register or read in from paper tape via a BBL.

SWITCH REGISTER INSTALLATION

SCE/1 can be loaded via the front panel switch register. The octal listing of SCE/1 in Table 2-1 is provided for this purpose. The HP 2100 Front Panel Procedures Guide in the Software Operating Procedures Manual describes the load procedure.

The switch register can also be used to restore SCE/1 if it is destroyed during system operation. The operator replaces symbolic items in Table 2-1 with values appropriate to the configuration.

Table 2-1. SCE/1 Octal Listing

		B							
		0	1	2	3	4	5	6	7
A	0m7700:	1077cc	1035cc	1025cc	067774	017741	067732	017741	007104
	0m7710:	017741	005323	106401	017741	017753	017753	017753	006021
	0m7720:	027765	017753	000000	077775	017753	077776	106601	047777
	0m7730:	017753	002041	177776	037776	067776	037775	027727	017753
	0m7740:	027714	000000	1066cc	1023cc	027743	1025cc	053772	127741
	0m7750:	053773	027742	027770	000000	1023cc	027754	1065cc	1035cc
	0m7760:	002020	002300	063772	1026cc	127753	017753	006021	002040
	0m7770:	102011	102077	170360	007417	170017	000000	000000	1z0100

Legend: A + B = Memory Address
 m = 0 for 4K, 1 for 8K, 2 for 12K, 3 for 16K, 5 for 24K, 7 for 32K memory
 cc = select code of Serial Interface card at satellite
 z = 7 for 4K, 6 for 8K, 5 for 12K, 4 for 16K, 2 for 24K, 0 for 32K memory

PAPER TAPE INSTALLATION

SCE/1 is contained in a paper tape (P/N 29037-60001). The same paper tape contains a second program which configures the SCE/1 instructions for the select code of the satellite's Serial Interface Card, constructs the memory-protect constant (core-size dependant) for SCE/1, and then moves a copy of the configured SCE/1 into the protected area of the computer.

The procedure outlined below may be used to install SCE/1 in 4K, 8K, 12K, 16K, 24K, and 32K memory computers.

- a. The SCE/1 Configurator/Installer paper tape (P/N 29037-60001) is loaded via the BBL or the program is down-loaded from central via an existing SCE/1 or SCE/2.

NOTE

If neither a BBL nor an SCE/1 or SCE/2 is available, the operator must install SCE/1 via the switch register as shown in Table 2-1.

- b. The satellite switch register is set as follows:

Switches:	Set to:
5-0	Select Code of satellite Serial Interface card
14-12	0 for 4K CPU
	1 for 8K CPU
	2 for 12K CPU
	3 for 16K CPU
	5 for 24K CPU
	7 for 32K CPU

NOTE

All other switches *must* be set to 0.

- c. The starting address (2_8) is loaded.
- d. The Loader is enabled, preset, and run.
- e. Halt 77B indicates successful installation.

Halt 22B indicates an invalid switch register setting:

- select codes less than 10B
- invalid CPU size indicated with switches 14-12
- extraneous switches

If Halt 22B is encountered, the switch register should be corrected and the procedure restarted from b.

RESTORE PAPER-TAPE BBL WITH SCE/1

Occasionally it is necessary to restore the paper tape BBL in the satellite computer. The following procedure can be used. This procedure assumes:

- a. The appropriate BBL for the satellite is stored under a file name in *Pnnnnnn* format at central.
- b. The SCE/1 Configurator/Installer is also stored at central under a file name in *Pnnnnnn* format.
- c. A configured SCE/1 is currently in the satellites protected area.

To restore the BBL a copy of the SCE/1 configurator/Installer is down-loaded from central and used to configure SCE/1, this configured version of SCE/1 is then used to down-load the BBL from central.

The SCE/1 Configurator/Installer maintains a copy of the configured SCE/1 starting at location 3700₈ (in the second page of computer memory); using this copy of SCE/1 allows the operator to down-load the BBL for a 4K computer. To load the BBL into a 4K computer:

- a. Set the switch register to the program number (*Pnnnnnn*) of the SCE/1 Configurator/Installer, and perform the down-load with the existing SCE/1.
- b. Configure the newly down-loaded SCE/1 Configurator/Installer, as described under the Paper Tape Installation procedure.
- c. Clear location 3777B to zero. This disables the memory protect check in SCE/1, allowing it to load a program itself.
- d. Set the switch register to the program number (*Pnnnnnn*) of the desired BBL.
- e. Load Address 3700₈
- f. Enable the satellite loader and Run.

SECTION III

APPLICATION PROGRAMS

STORAGE REQUIREMENTS

The SCE/1 load procedure requires that a program file be stored on the central disc. The program must be in absolute format and stored in a file with the required name format. The file name must be in the form: *Pnnnnn*, where *nnnnn* is the ASCII equivalent of the octal number entered at the satellite switch register as described in the load procedure.

LOAD PROCEDURE

After SCE/1 has been installed, absolute program files containing the SCE/3, SCE/4, or SCE/5 operating systems can be down-loaded into an satellite with the following procedure.

- a. CCE is activated at the central computer as described in the Central Communications Executive Manual.
- b. The octal value of the required program file is set in bits 14-0 of the switch register. For example, if P00005 is down-loaded, the switch register setting is:

- c. The starting address of SCE/1 is set to 0m7700 (see Table 2-1).
- d. The loader is enabled; preset and run.
- e. When the computer halts, it contains one of two values:

102011 -Data Transmission Error. For recovery, confirm the program file is on disc and retry from step b.

102077 -Successful Transmission.
- f. If no transmission errors occur, the down-loaded program can be executed from its starting address as if it were loaded from the satellite paper tape reader.
