

PRN 545
TROUBLESHOOT TEST CALL

This routine is the routine used to call test if the test is going to be run in troubleshoot mode. This routine preforms the same function as FRN 665. The only difference is the variable stored in SCOM for use by SLOPE. For a description and flowchart see ET-9500-97009-1 FRN 665. The only change is in line 430 of the BASIC program. FRN 545 stores a 3 in SCOM on this line instead of 0.
